Database
Amazon DynamoDB
A fast and flexible NoSQL database service for any scale
DynamoDB is a fully managed, key-value, and document database that delivers single-digit-millisecond performance at any scale.
Get started
Create a new table to start exploring DynamoDB.
Create table

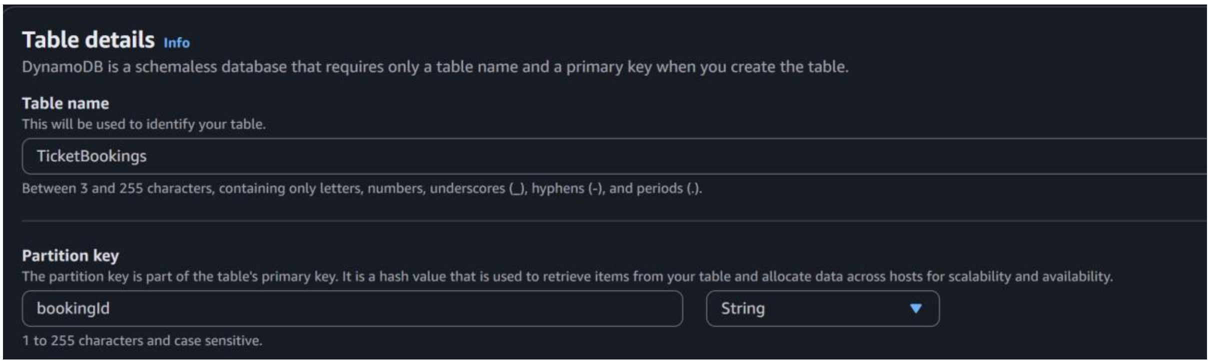

Table details Info
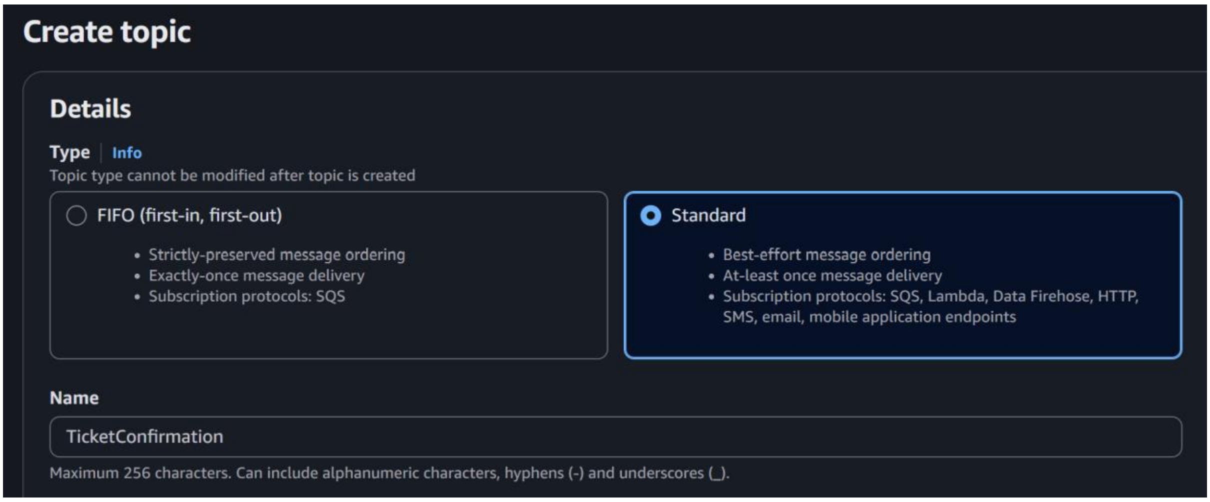
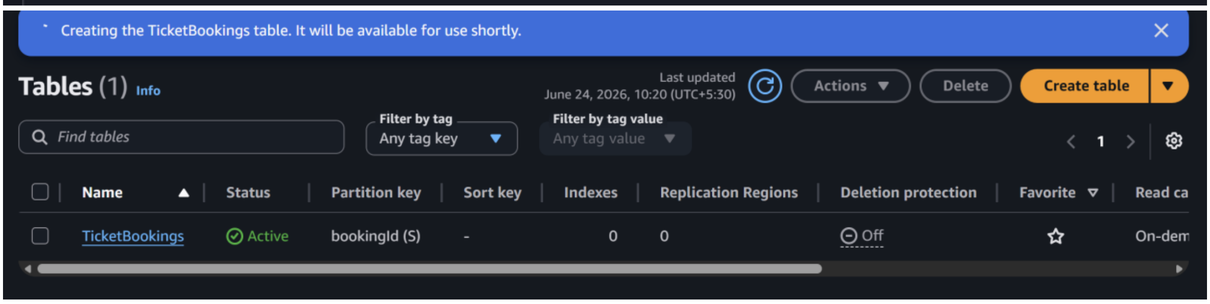
DynamoDB is a schemaless database that requires only a table name and a primary key when you create the table.
Table name
This will be used to identify your table.
TicketBookings
Between 3 and 255 characters, containing only letters, numbers, underscores (_), hyphens (-), and periods (.).
Partition key
The partition key is part of the table's primary key. It is a hash value that is used to retrieve items from your table and allocate data across hosts for scalability and availability.
bookingId
String
1 to 255 characters and case sensitive.



Create topic
Details
Type Info
Topic type cannot be modified after topic is created
FIFO (first-in, first-out)
Strictly-preserved message ordering
Exactly-once message delivery
Subscription protocols: SQS
Standard
Best-effort message ordering
At-least once message delivery
Subscription protocols: SQS, Lambda, Data Firehose, HTTP, SMS, email, mobile application endpoints
Name
TicketConfirmation
Maximum 256 characters. Can include alphanumeric characters, hyphens (-) and underscores (_).



Creating the TicketBookings table. It will be available for use shortly.

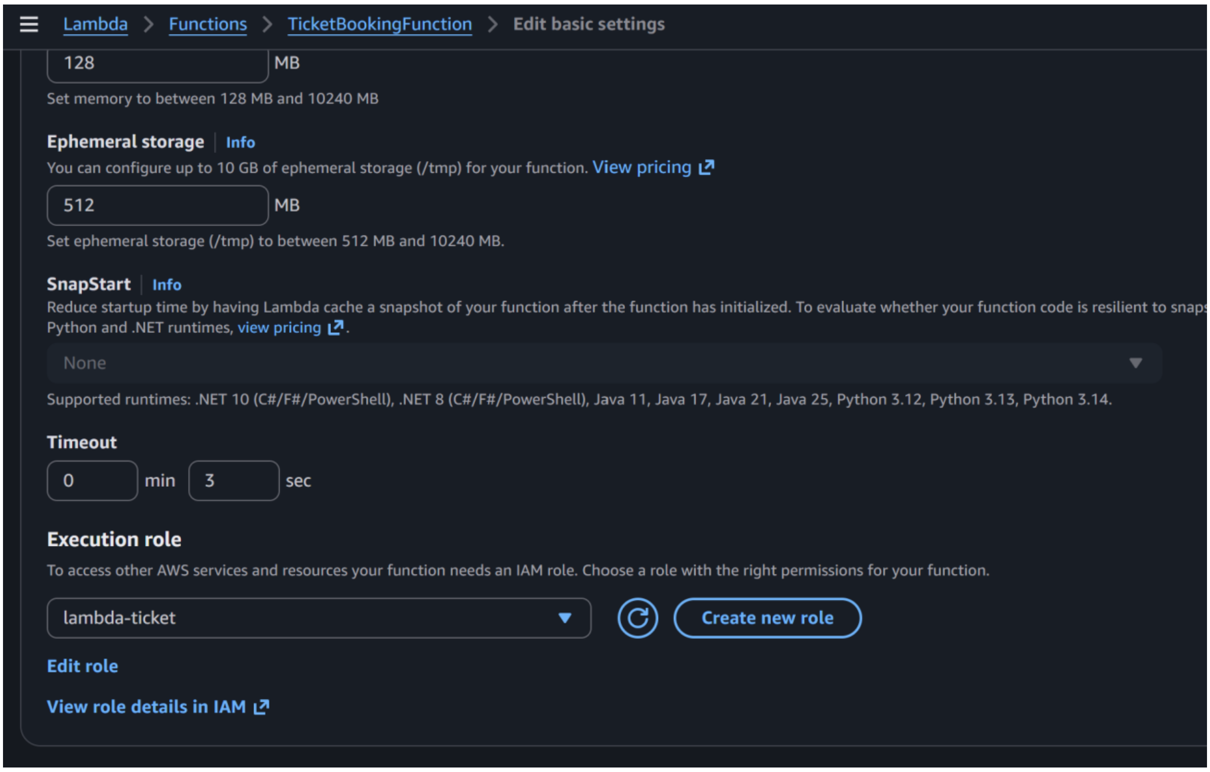
Compute
AWS Lambda
Run code without managing servers.
Focus on your application, not your infrastructure. Lambda automatically provisions, scales, and monitors while you build.
Get started
Bring your own code, or choose a ready-to-deploy example.
Create a function



Lambda > Functions > TicketBookingFunction > Edit basic settings
128 MB
Set memory to between 128 MB and 10240 MB
Ephemeral storage | Info
You can configure up to 10 GB of ephemeral storage (/tmp) for your function. View pricing
512 MB
Set ephemeral storage (/tmp) to between 512 MB and 10240 MB.
SnapStart | Info
Reduce startup time by having Lambda cache a snapshot of your function after the function has initialized. To evaluate whether your function code is resilient to snaps
Python and .NET runtimes, view pricing.
None
Supported runtimes: .NET 10 (C#/F#/PowerShell), .NET 8 (C#/F#/PowerShell), Java 11, Java 17, Java 21, Java 25, Python 3.12, Python 3.13, Python 3.14.
Timeout
0 min 3 sec
Execution role
To access other AWS services and resources your function needs an IAM role. Choose a role with the right permissions for your function.

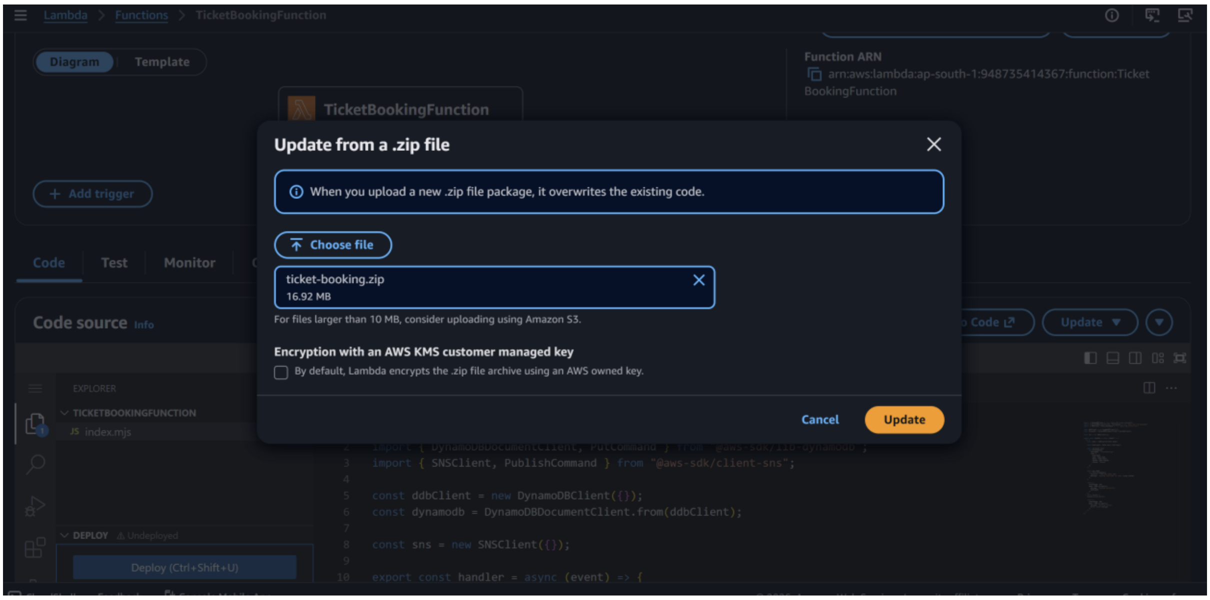
API Gateway
Create and manage APIs at scale
Amazon API Gateway is a fully managed service that makes it easy for developers to create, publish, maintain, monitor, and secure APIs.
Get started
Create a new API to begin exploring API Gateway. You can also import an external definition file into API Gateway.
Create an API



Lambda > Functions > TicketBookingFunction
Diagram
Template
TicketBookingFunction
Function ARN
arn:aws:lambda:ap-south-1:948735414367:function:TicketBookingFunction
+ Add trigger

Monitor
Code source Info
Update from a .zip file
When you upload a new .zip file package, it overwrites the existing code.
Choose file
ticket-booking.zip
16.92 MB
For files larger than 10 MB, consider uploading using Amazon S3.
Encryption with an AWS KMS customer managed key
By default, Lambda encrypts the .zip file archive using an AWS owned key.

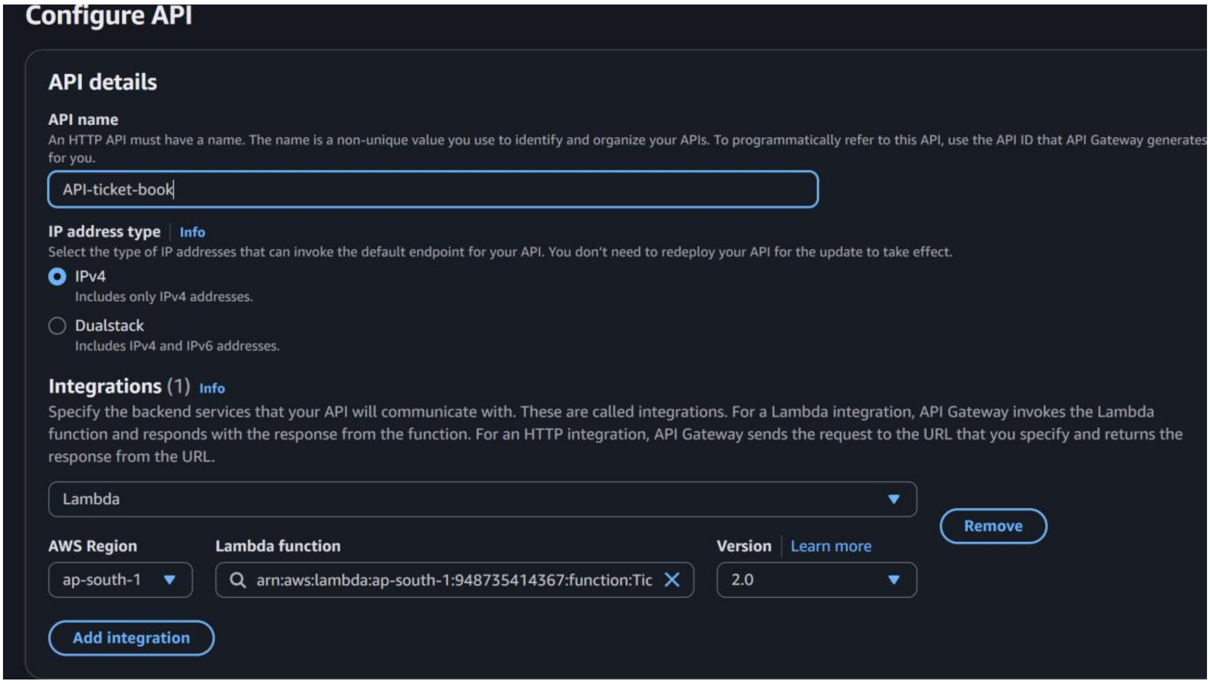
import { SNSClient, PublishCommand } from "@aws-sdk/client-sns";
const ddbClient = new DynamoDBClient({});
const dynamodb = DynamoDBDocumentClient.from(ddbClient);
const sns = new SNSClient({});
export const handler = async (event) => {



Configure API
API details
API name
An HTTP API must have a name. The name is a non-unique value you use to identify and organize your APIs. To programmatically refer to this API, use the API ID that API Gateway generates for you.
API-ticket-book
IP address type Info
Select the type of IP addresses that can invoke the default endpoint for your API. You don't need to redeploy your API for the update to take effect.
IPv4
Includes only IPv4 addresses.
Dualstack
Includes IPv4 and IPv6 addresses.
Integrations (1) Info
Specify the backend services that your API will communicate with. These are called integrations. For a Lambda integration, API Gateway invokes the Lambda function and responds with the response from the function. For an HTTP integration, API Gateway sends the request to the URL that you specify and returns the response from the URL.

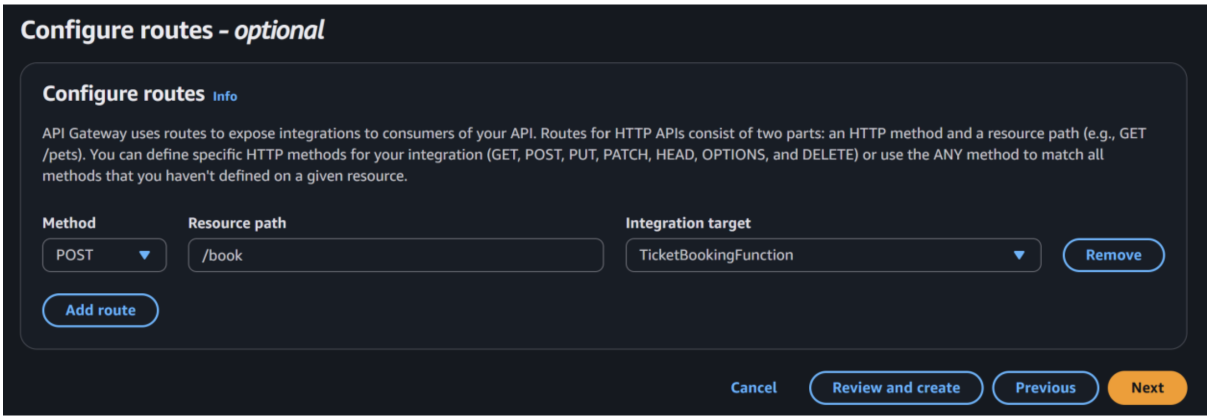
Add integration



Configure routes - *optional*
Configure routes Info
API Gateway uses routes to expose integrations to consumers of your API. Routes for HTTP APIs consist of two parts: an HTTP method and a resource path (e.g., GET /pets). You can define specific HTTP methods for your integration (GET, POST, PUT, PATCH, HEAD, OPTIONS, and DELETE) or use the ANY method to match all methods that you haven't defined on a given resource.
